

D.I.Y. Project #43

How to build a Death Star

1 Find suitable space

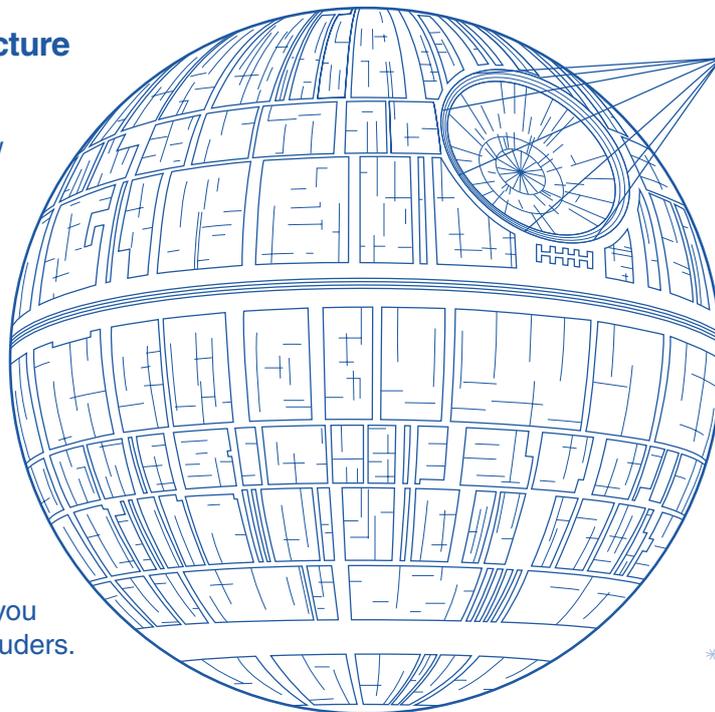

Place your Death Star far, far away from water hazards, fire risks and Anoat asteroid belts.

2 Fit heating and insulation

With temperatures dropping to -270°C it is advisable to be sufficiently insulated. We recommend Knauf Space Loft Roll, now available at Wickes.

3 Paint external structure

Give your Death Star a deep, ominous finish with Wickes Grey Chic Shadow emulsion paint.

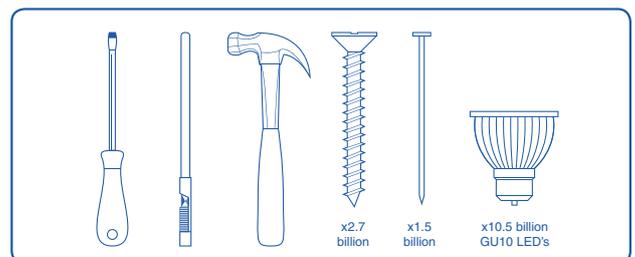

4 Securing power source

Position reactor core towards centre of Death Star and fasten tightly into position using cable ties. Pick up a 250 pack in-store.

5 Connect alarms

Fit a Yale alarm near the exhaust entrance to alert you to unexpected X-Wing intruders. Available at Wickes.

Trade Tip

If you're cutting through metal and don't have an angle grinder to hand a lightsaber can work as a great alternative.

Health & Safety

To avoid injury when lifting heavy objects remember to bend your knees and keep your back straight. Alternatively, use The Force. When up a ladder always ask a Stormtrooper to hold the base for extra stability. DO NOT use ladder in the event of a Rebel attack.

1 Hour Click & Collect

If you're busy planning galaxy takeovers use our handy 1 Hour Click & Collect service to save time.
